Phishing Threats

Brand impersonation takes place when a threat actor creates a social account pretending to be your brand. SOCRadar can spot fraudulent and fake domain. Also can spot fake social accounts by monitoring well-known social media platforms so that you can quickly take action to stop possible phishing scams.

Stealer Logs

As one of the emerging underground market, threat actors are selling stolen identities from malware bot-infected devices frequently advertised as stealer logs. These bots-for-sale marketplaces affect not just users whose credentials and digital identities are stolen, but also the organizations that users are working for. SOCRadar provides you the continuous visibility to detect this evolving threat.

Related malware families

AZORult Trojan

The AZORult malware was first discovered in 2016 to be an information stealer that steals browsing history, cookies, ID/passwords, cryptocurrency information and more. It can also act as a downloader of other malware. It was sold on Russian underground forums to collect various types of sensitive information from an infected computer.

Raccoon Infostealer

Raccoon emerged as Malware as a Service (MaaS) in April 2019. The malware is capable of stealing login credentials, credit card information, cryptocurrency wallets, and browser information. Raccoon has basic infostealer functions but an aggressive marketing campaign and overall good user experience proved enough to make up for its lack of additional features.
